Bacterial infection of wound can impede the healing process and lead to life-threatening complications. Scientists at Sheffield University have used light to rapidly detect the presence of bacteria, by developing a portable kit in which specially designed molecules emit a light signal when bound to bacteria. Current laboratory-based detection of bacteria can take hours or days.

The wound healing process is not only complex but also fragile, and it is susceptible to interruption or failure leading to the formation of non-healing chronic wounds. Factors that contribute to non-healing chronic wounds are diabetes, venous or arterial disease, infection, and metabolic deficiencies of old age.

1. Introduction. During the wound healing process, dressings are used for the regeneration and repairing of dermal and epidermal tissues. Wound dressing materials, as physical barriers permeable for moisture and oxygen, protect the wound mainly against microorganisms (Adamian et al., 2004). For the stimulation of wound healing, a passive dressing is essential for maintaining an optimally moisture.
