measuring particle size before and after the process. Particle size growth may be monitored during operations such as granulation or crystallization. Determining the particle size of powders requiring mixing is common since materials with similar and narrower distributions are less prone to segregation.

grain of sand or a pigment particle in a can of paint. If I am a Q.A. Manager, I will want one number only to describe my particles – I will need to know if the average size has increased or decreased since the last production run, for example. This is the basic problem of particle size analysis – how do we describe a 3-dimensional object ...

1.1 This method covers the quantitative determination of the distribution of particle sizes in soils. The distribution of particle sizes larger than 75 μm (No. 200) is determined by sieving, while the distribution of particle sizes smaller than 75 μm is determined by a sedimentation process, using a hydrometer to secure the necessary data.
