Discrete Probability Distributions The most common way to display a probability distribution function (pdf) for discrete data is with a table. The probability distribution table always has two columns (or rows) The first,  $x$ , displays all the possible outcomes.

The conditional probability distribution of  $Y$  given  $X$  is the probability distribution you should use to describe  $Y$  after you have seen  $X$ . It is a probability distribution like any other. It is described by in any of the ways we describe probability distributions: PMF, PDF, DF, or by change-of-variable from some other distribution.

Probability mass function (PMF) of a discrete r.v.  $X$  It is the probability law or probability distribution of  $X$  If we  $\tilde{\cdot}x$  some  $x$ , then  $\tilde{\cdot}X = x$  is an event

The probability-density function of the random variable  $X$  is a function such that the area under the density-function curve between any two points  $a$  and  $b$  is equal to the probability that the random variable  $X$  falls between,  $a$  and  $b$ .

Probability models A probability model for a random variable consists of: the collection of all possible values

of a random variable the probabilities that the values occur For a discrete random variable the probability model lists the possible values the random variable takes and the probability which it takes those values.
