The gravity model of international trade in international economics is a model that, in its traditional form, predicts bilateral trade flows based on the economic sizes (often using GDP measurements) and distance between two units.. The model was first introduced in economics world by Walter Isard in 1954. The basic model for trade between two countries (i and j) takes the form of

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.
