High temperature (the torch flame) Crystallography is the experimental science of the arrangement of atoms in solids. The word "crystallography" derives from the Greek words *crystallon* = cold drop / frozen drop, with its meaning extending to all solids with some degree of transparency, and *grapho* = write.

Mineralogy is basically the science of minerals, which includes their crystallography, chemical composition, physical properties, genesis, their identification and their classification. You will be interested to know that mineralogy is closely allied to mathematics (especially geometry), chemistry and physics.

## LECTURE 1 MINERALOGY AND CRYSTALLOGRAPHY

Crystallography is the study of crystals and the crystalline state. Crystallography is the key in understanding the structures of crystalline materials. Hence it forms the natural introduction to the study of rocks and minerals since they are all predominantly crystalline materials.

The smallest unit of a structure that can be indefinitely. repeated to generate the whole structure. Irrespective of the external form (euohedral, subhedral, or. anhedral) the properties and symmetry of every crystal can. be condensed into the study of one single unit cell.

The unit cell is given by the length of the three axes,  $a$ ,  $b$  and  $c$  (unit cell dimensions, unit cell parameters, cell edges; i.e. the lengths of the vectors.  $t_1$ ,  $t_2$  and  $t_3$ ) and the angles  $\hat{1}_\pm$ ,  $\hat{1}^2$  and  $\hat{1}^3$ . Definition of the angles relative to the axes ( $t_1$ ,  $t_2$  and  $t_3$  or equivalent  $a$ ,  $b$  and  $c$ ) is shown in Figure 1.

THE ELEMENTS OF CRYSTALLOGRAPHY X-ray crystallography The Bragg diffraction formula It is well known that if two waves encounter each other they will interfere constructively if they are in phase (in step). If they are out of phase they will interfere destructively (cancel each other). This is the phenomenon of diffraction.
