Classical mechanics describes the motion of macroscopic objects, from projectiles to parts of machinery, and astronomical objects, such as spacecraft, planets, stars and galaxies.. If the present state of an object is known it is possible to predict by the laws of classical mechanics how it will move in the future (determinism) and how it has moved in the past (reversibility).

Hamiltonian mechanics is a theory developed as a reformulation of classical mechanics and predicts the same outcomes as non-Hamiltonian classical mechanics. It uses a different mathematical formalism, providing a more abstract understanding of the theory. Historically, it was an important reformulation of classical mechanics, which later contributed to the formulation of statistical mechanics ...

Quaternion. The quaternions are members of a noncommutative division algebra first invented by William Rowan Hamilton. The idea for quaternions occurred to him while he was walking along the Royal Canal on his way to a meeting of the Irish Academy, and Hamilton was so pleased with his discovery that he scratched the fundamental formula of quaternion algebra,

Le tecniche matematiche utilizzate permettono di distinguere all'interno della meccanica razionale la meccanica lagrangiana e la meccanica hamiltoniana, che arriva allo studio delle varietà simplettiche e di Poisson.. Sistemi meccanici centrali nella teoria sono quelli composti da un numero finito di punti materiali soggetti a forze, sia che essi siano liberi di muoversi in uno spazio ...

In fisica, in particolare in meccanica classica, il centro di massa o baricentro di un sistema  $\tilde{A}$  il punto geometrico corrispondente al valor medio della distribuzione della massa del sistema nello spazio. Nel caso particolare di un corpo rigido, il baricentro ha una posizione fissa rispetto al sistema. Il baricentro, tuttavia,  $\tilde{A}$  definito per un qualunque sistema di corpi massivi ...
